The National Council of Juvenile and Family Court Judges® (NCJFCJ) headquartered on the University of Nevada campus in Reno since 1969, provides cutting-edge training, wide-ranging technical assistance, and research to help the nation's courts, judges, and staff in their important work. Since its founding in 1937 by a group of judges dedicated to improving the effectiveness of the nation's juvenile courts, the National Council of Juvenile and Family Court Judges (NCJFCJ) has pursued a mission to improve courts and systems practice and raise awareness of the core issues that touch the lives of many of our nation's children and families.

Disproportionality Rates for Children of Color in Foster Care

Children of color are disproportionately¹ represented in the United States foster care system. In most states, there are higher proportions of African American/Black and Native American children in foster care than in the general child population (Hill, 2006). In some states, Hispanic/Latino children are disproportionately represented as well. The overrepresentation of children of color is an issue of interest to juvenile dependency stakeholders, practitioners, and scholars. This Technical Assistant Bulletin briefly describes the issue of disproportionality, including an overview of prior research and information on how disproportionality can be measured. Disproportionality rates are then presented for all 50 states and the National Council of Juvenile and Family Court Judges Model Court jurisdictions.²

Starting in 1997, the Adoption and Safe Families Act (P.L. 105-89) required child welfare agencies to submit data regarding children in foster care to the Adoption and Foster Care Analysis and Reporting System (AFCARS). The AFCARS data include the number of children who have entered foster care, the number who have exited foster care, and the number who are still in foster care at the end of the year. The dataset also contains basic demographic information, including race for each child.

In 2000, African American/Black children represented 36% of the foster care population, even though they comprised only 15% of the general child population. Native American children represented 2.6% of the foster care population, yet only encompassed 1.2% of the general child population. Hispanic/Latino children, although not overrepresented nationally, were disproportionately represented in 17 states. These numbers have led child welfare system stakeholders to make efforts to increase awareness of the issue of disproportionality (Child Welfare League of America, 2003). Many of these early efforts had little success, as the proportion of children of color in foster care continued to increase between 2000 and 2004 (United States Government Accountability Office, 2007).

The 2007 Government Accountability Office report identified every state's disproportionality index using 2004 population estimates and 2004 AFCARS data. The disproportionality findings were summarized in a table that illustrated the problem of disproportionality and highlighted states whose disproportionality rates were greater than 2 (i.e., this racial/ethnic group was represented in foster care at a rate twice their proportion in the general population). We have duplicated this table and included the 2009 data for comparison. Some states have substantially reduced their disproportionality. Other states show slight increases or decreases, or have remained consistent in the five-year time span. Overall, in 2004, the United States had an African American/Black disproportionality rate of 2.65. In 2009, this was reduced to 2.36. The change for Native American children has been slightly less prominent. In 2004, the overrepresentation score for Native American children in the nation was 1.83. In 2009, that was reduced slightly to 1.76. Table 1 illustrates the 2004 and 2009 disproportionality rates for children in foster care for each state and nationally.

¹ Disproportionality is the level at which groups of children are present in the child welfare system at higher or lower percentages or rates than in the general population.

² Small jurisdictions are not uniquely identified in the AFCARS dataset. Therefore, data was not available for all Model Courts.

Table 1:
Disproportionality Index of Children in Foster Care by Race and State for 2004 and 2009³

ⁱ Children identified by the child welfare system as African American, non-Hispanic, and with only one race category.

ⁱⁱ Children identified by the child welfare system as White, non-Hispanic, and with only one race category.

ⁱⁱⁱ Children identified by the child welfare system as having Hispanic origins; not a racial category.

^{iv} Children identified by the child welfare system as Asian, which includes Hawaiian and Pacific Islander, non-Hispanic and with only one race category.

^v Children identified by the child welfare system as Native American, non-Hispanic, and with only one race category.

CALCULATING DISPROPORTIONALITY

Disproportionality is defined as the level at which groups of children are present in the child welfare system at higher or lower percentages or rates than in the general population. Hill (2006) developed the “disproportionality index” as an indicator of the degree a given jurisdiction is disproportionate.³ The disproportionality index is calculated by taking the proportion of children in foster care for a given race and dividing it by the proportion of the same racial group in the child population. This creates a ratio where scores ranging from 0.00 to 0.99 are indicative of underrepresentation, scores of 1.0 indicate no disproportionality, and scores of 1.1 and greater indicate overrepresentation. For example, in a community where 40% of the children entering foster care are African American, and only 20% of the child population is African American, the disproportionality index would be 2.0, indicating African Americans are twice as represented in foster care as they are in the general population. Disproportionality scores are calculated for the number of children “entering” care, “exiting” care, and “remaining” in care at the end of the year. These calculations require (1) the *child population (by race)* for any given state or jurisdiction, available from census data; and (2) the *number of children in the child welfare system (by race)*, available from the AFCARS.

DATA SOURCES		
Data Element	Available From	Most Recent Date
<i>Child Population (by Race)</i>	The U.S. Census Bureau (Total Population – Adult Population) www.census.gov	2010
<i>Number of Children In Care Entering Care Exiting Care (by Race)</i>	National Data Archive on Child Abuse and Neglect’s Adoption and Foster Care Analysis and Reporting System (AFCARS) www.ndacan.cornell.edu	2009

³ We would like to thank Casey Family Programs (www.casey.org) for their contribution in the development of the racial disproportionality index template.

The results of these disproportionality calculations are presented numerically and graphically. The graph on the left compares the racial breakdown of the population to the percentage of each racial group entering, in, and exiting foster care in 2009. In this chart, the race of African American/Black children in the population is approximately 14 % (first oval). Compare that to the rate of African American/Black children in foster care—more than 30% (larger oval). These differences are also reported in a corresponding table under the graph (see below).

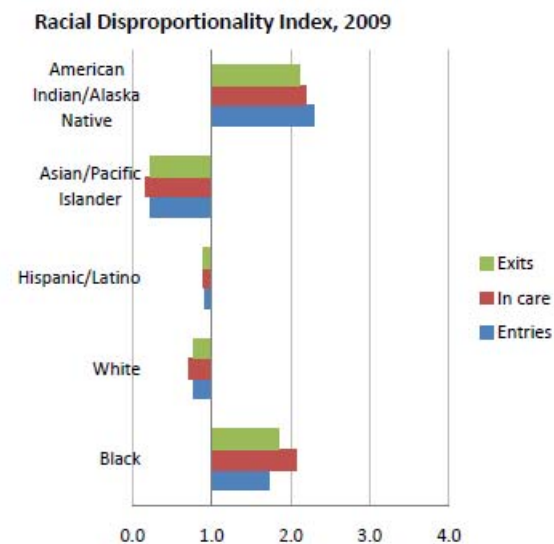

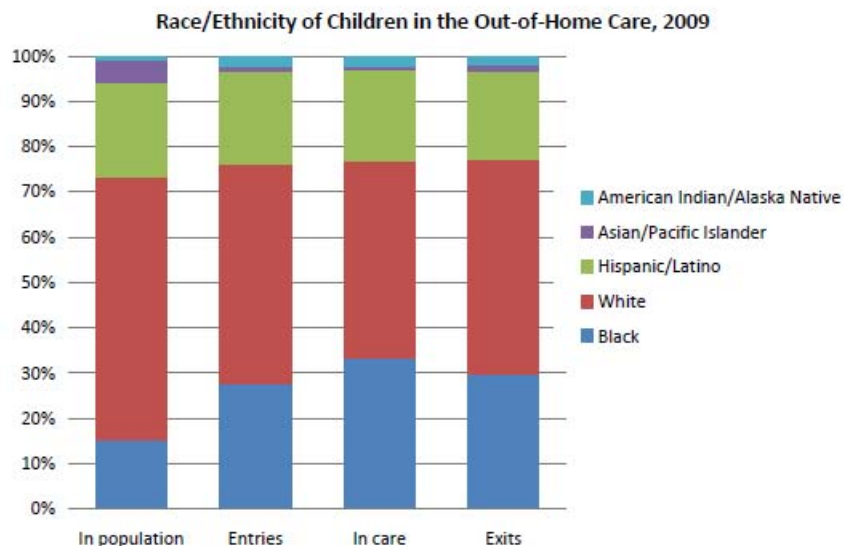

Race/ethnicity breakdowns				
	Population	Entries	In care	Exits
African American/Black (a)	14.5%	25.1%	30.1%	26.9%
Caucasian/White (b)	55.6%	43.6%	39.5%	43.0%
Hispanic/Latino (c)	20.1%	18.3%	18.1%	17.9%
Asian/Pacific Islander (d)	4.6%	1.1%	0.8%	1.0%
American Indian/Alaska Native (e)	0.9%	2.1%	2.0%	1.9%
More than one race	3.9%	6.9%	2.0%	6.9%
Missing	0.3%	2.9%	7.4%	2.4%
Total	100%	100%	100%	100%

The graph (right) and table (below) portray the disproportionality index. The *Racial Disproportionality Index* graph depicts the disproportionality scores for each race in terms of entries, exits, and in care rates. Bars moving to the right of 1.0 indicate overrepresentation; bars moving to the left of 1.0 demonstrate underrepresentation. The highlighted text in the *Racial Disproportionality Index* table below identifies disproportionality indexes in which the racial group is overrepresented.

Racial Disproportionality Index			
	Entries	In care	Exits
African American/Black (a)	1.7	2.1	1.9
Caucasian/White (b)	0.8	0.7	0.8
Hispanic/Latino (c)	0.9	0.9	0.9
Asian/Pacific Islander (d)	0.2	0.2	0.2
American Indian/Alaska Native (e)	2.3	2.2	2.1

Hispanic/Latino (c)	0.9	0.9	0.9
Asian/Pacific Islander (d)	0.2	0.2	0.2
American Indian/Alaska Native (e)	2.3	2.2	2.1

Disproportionality is the level at which groups of children are present in the child welfare system at higher or lower percentages or rates than in the general population. An index of 1.0 reflects no disproportionality. An index of greater than 1.0 reflects overrepresentation. An index of less than 1.0 reflects underrepresentation.

Disproportionality continues to be a trend throughout the nation. As noted in the graphs above, African American/Black children and Native American children are consistently overrepresented in the foster care system. These graphs illustrate the national average across all 50 states. Within this national trend, there are considerable variances at the state and local levels.

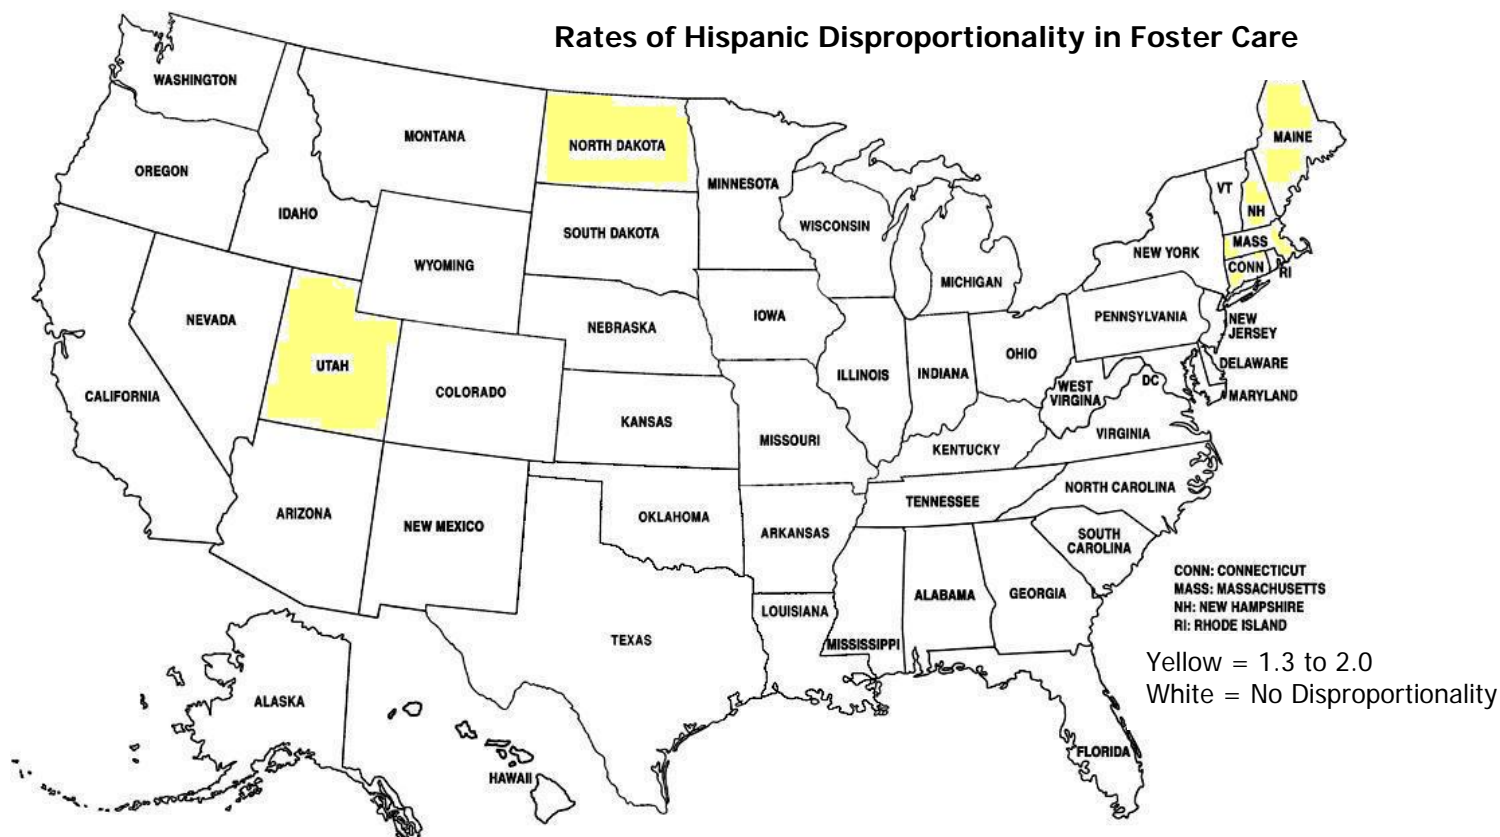

Comparisons of Disproportionality by State Native American

Across the United States, Native American children are overrepresented in foster care at a rate of 2.2 times their rate in the general population. While not all state show disproportionality, 21 states do have some overrepresentation. Twenty-six percent of the states that have overrepresentation have a disproportionality index of greater than 4.1. In Minnesota, the disproportionality is index 11.6.

Comparisons of Disproportionality by State Hispanic/Latino

The rates of Hispanic/Latino overrepresentation across the country are less pronounced. Only a handful of states demonstrate overrepresentation of Hispanic/Latino children. Overrepresentation rates vary from 1.3 to 2.0. None of the states have a disproportionality index score of greater than two. There may be, however, more overrepresentation at the county or court jurisdiction level. For example, Santa Clara County, CA (see page 79) has a disproportionality score of 1.6, showing overrepresentation of Hispanic/Latino children. Yet, California (as a whole) does not demonstrate disproportionality of Hispanic/Latino children. It is important to examine state and jurisdiction disproportionality indexes to gain a more in-depth understanding of how disproportionality rates vary by location.
